

# FRAMEBOOT

**Design Registration No. 419448**

**Trademark: Frameboot**

## **Function:**

The Frameboot is designed to protect the end grain of the bottom plate of a frame opening that goes to the floor. Notably a garage door rebate but also front and back doors, ranchsliders, French doors and floor to ceiling windows. This is an area largely left untouched by weathertightness issues that New Zealand has faced in the last decade. Quite often these plates are holding the largest lintels in the house; therefore they need to be protected from water ingress.

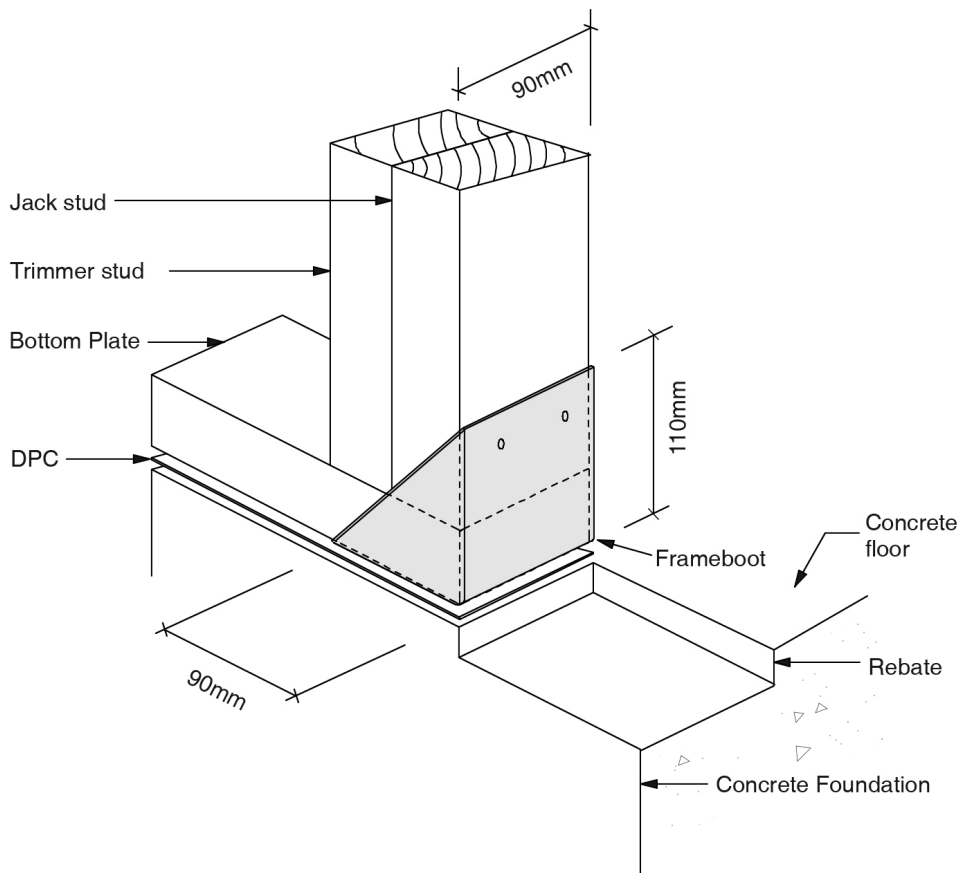

## **Design:**

The product has been designed to wrap the bottom plate and up the front of the jack stud and adjacent studs. This is the area where the end grain of timber is exposed.

## **Product Specifications:**

Side measurement 90mm x base measurement 91.5mm

Material: pliable plastic 1.5mm thick

## **Frameboot Detail**

Scale 1:5
